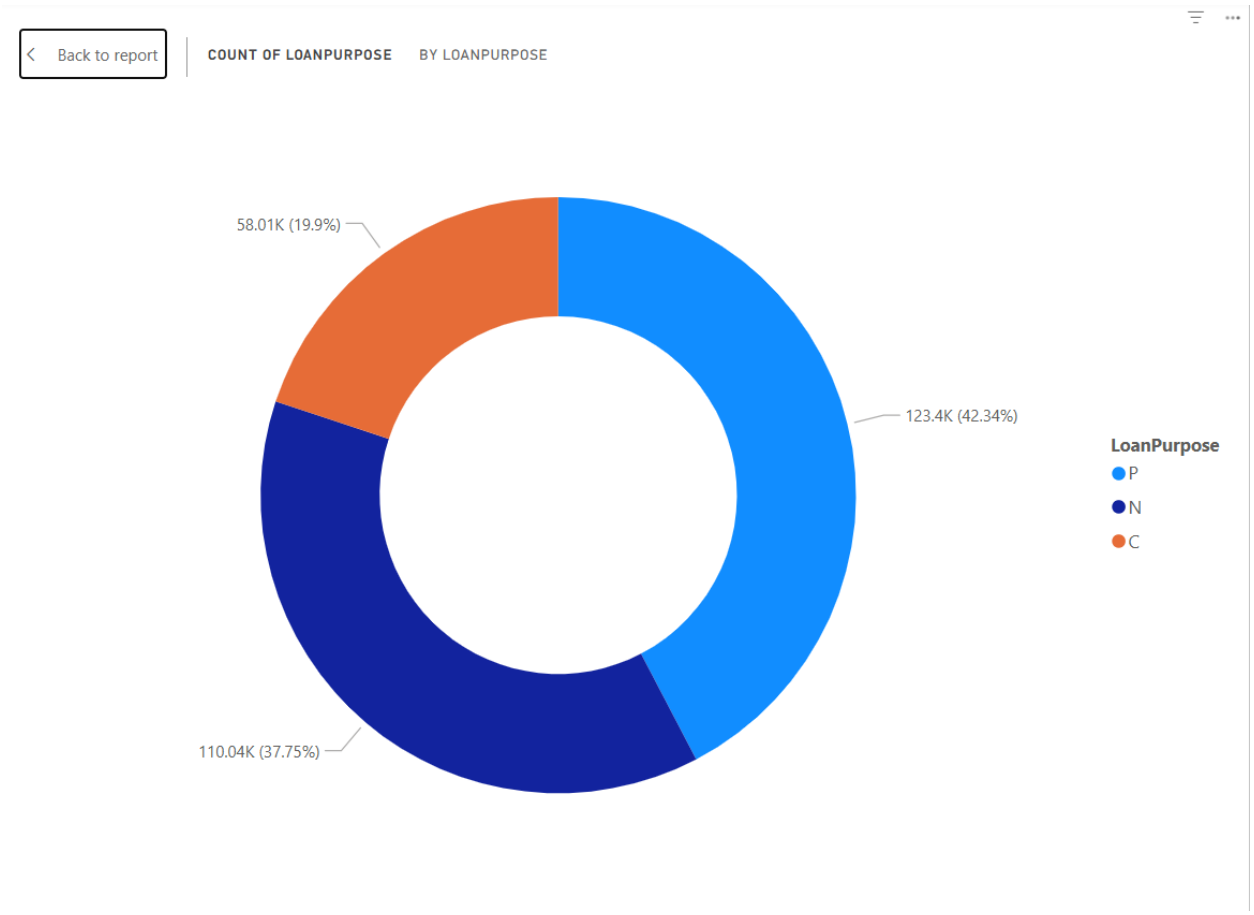
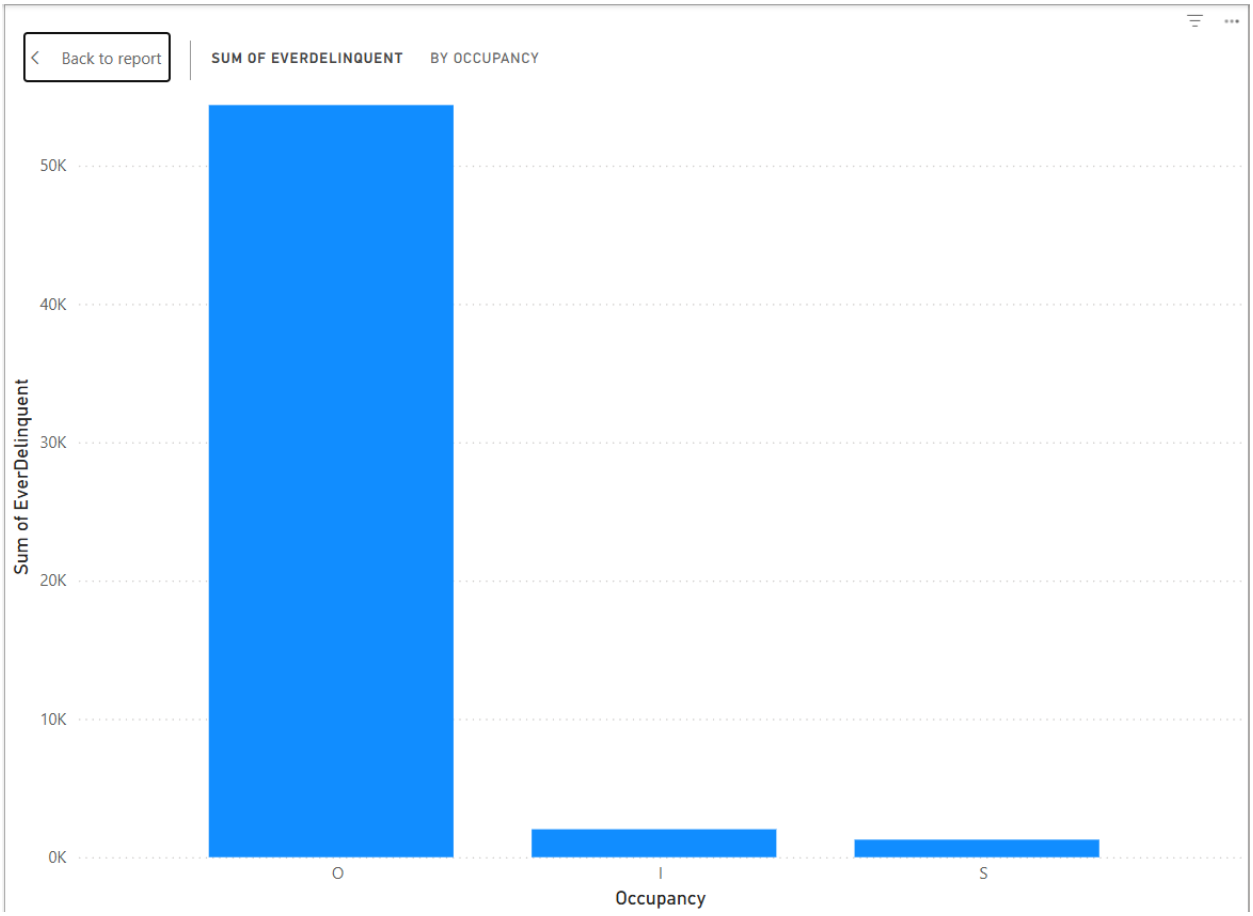
1. Count of LoanPurpose by LoanPurpose



- **Description**: This donut chart shows the distribution of mortgage loans by their purpose.
- **Findings**:
  - **P (Purchase)**: 123.4K loans (42.34%)
  - **N (New Construction or similar)**: 110.04K loans (37.75%)
  - **C (Cash-Out Refinance)**: 58.01K loans (19.9%)
- **Conclusion**: The majority of loans are originated for purchasing purposes. Cash-out refinances represent a smaller share, potentially due to tighter underwriting or borrower caution.

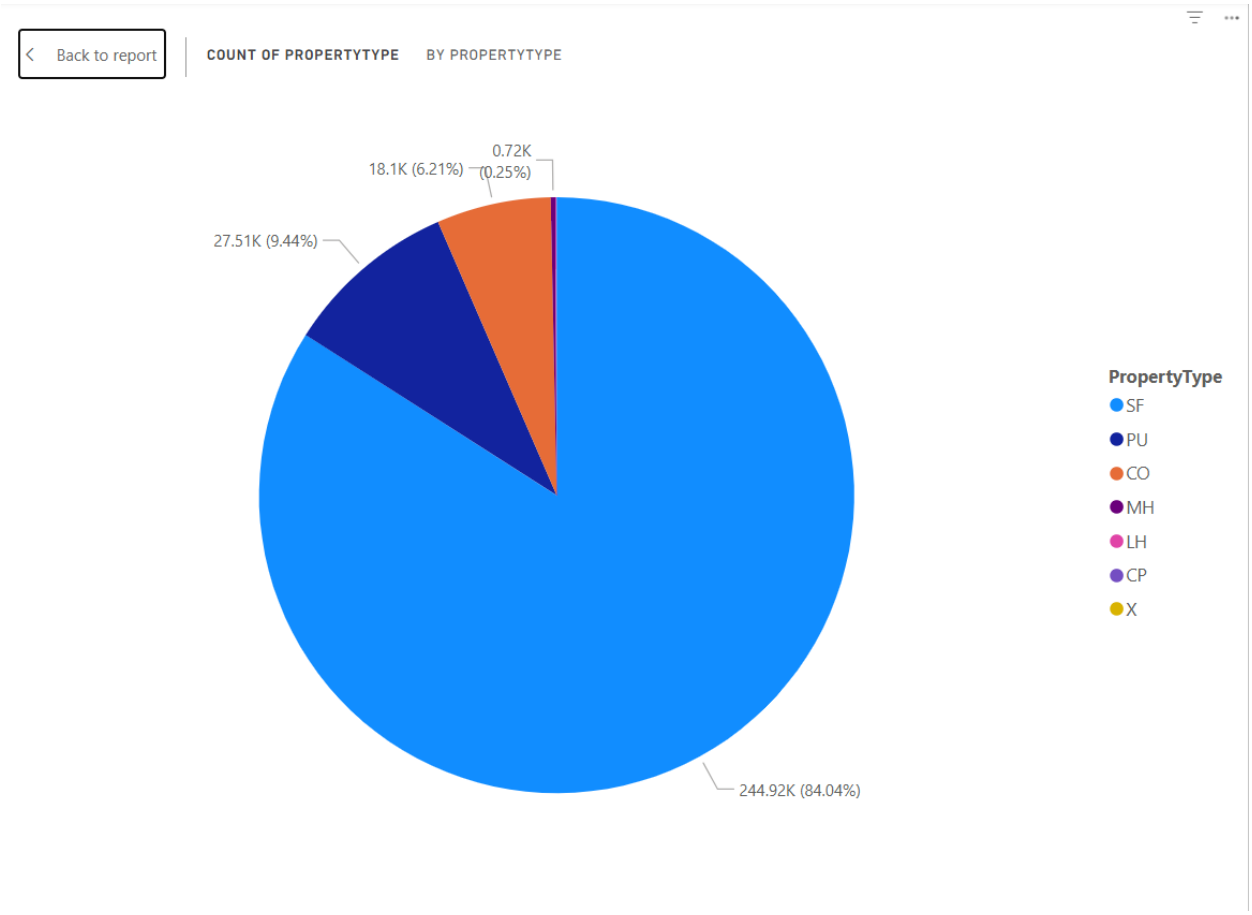
2. Sum of EverDelinquent by Occupancy



- **Description**: This bar chart displays the total number of delinquent loans by occupancy type.
- **Findings**:
  - **O (Owner-Occupied)** properties have significantly higher delinquencies (~55K).
  - **I (Investor)** and **S (Second Home)** have negligible delinquencies.
- **Conclusion**: Owner-occupied properties show higher delinquency, possibly due to more lenient underwriting or economic hardship impacting primary residences more than investment or vacation homes.

---

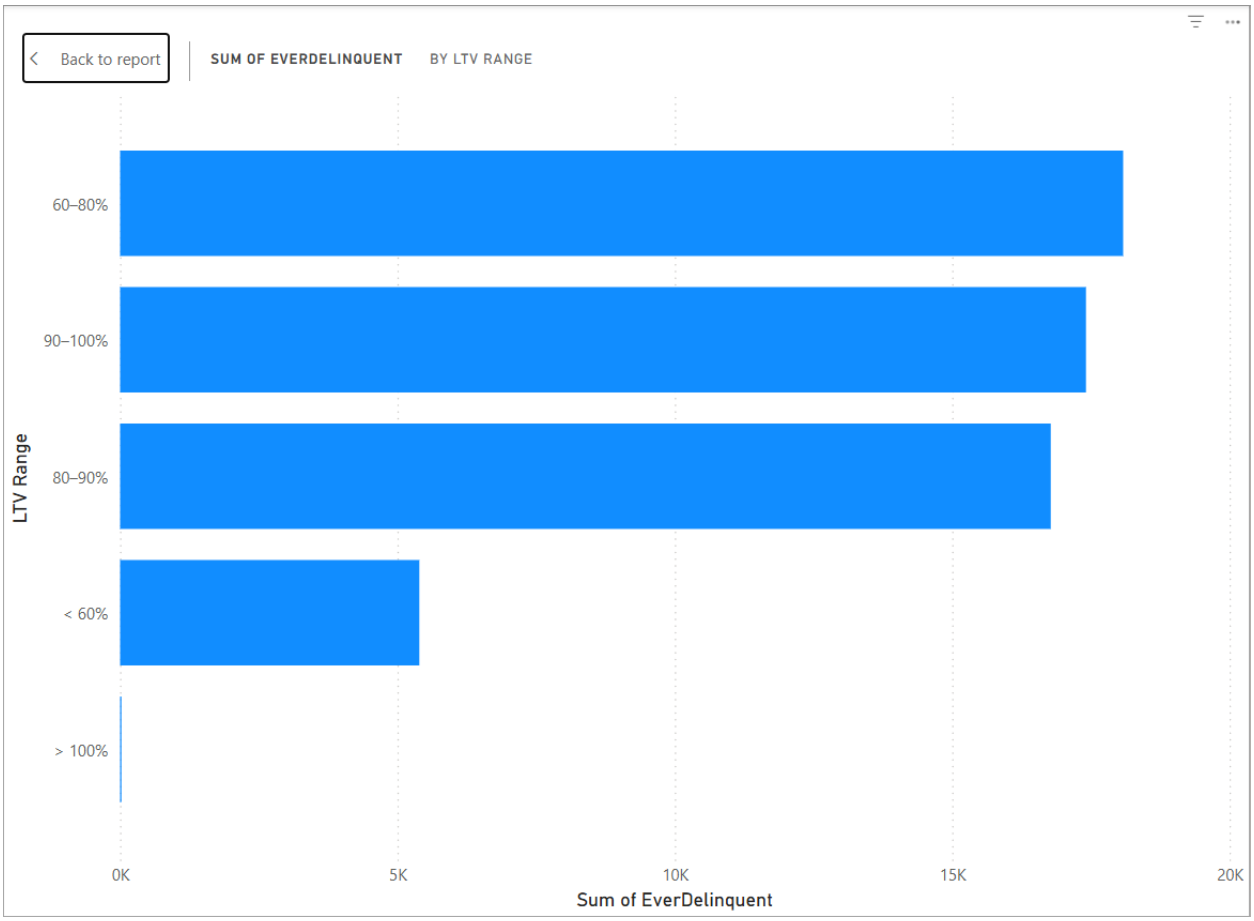
3. Count of PropertyType by PropertyType



- **Description**: A pie chart indicating the distribution of property types in the portfolio.
- **Findings**:
  - **SF (Single Family)**: 244.92K loans (84.04%)
  - Other types like **PU, CO, MH, LH, CP, X** make up a much smaller portion.
- **Conclusion**: The portfolio is heavily skewed toward single-family homes, which suggests a traditional residential mortgage focus.

---

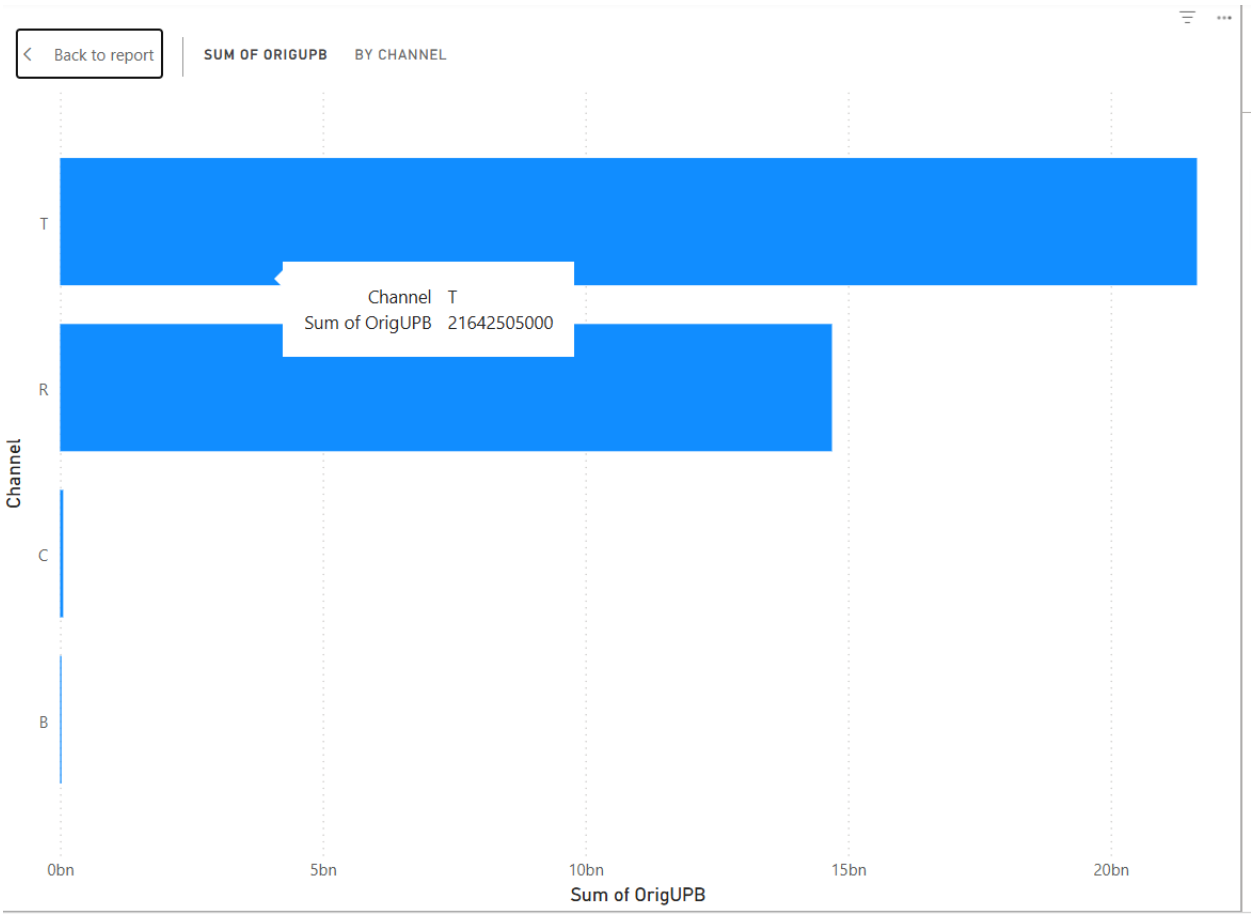
4. Sum of EverDelinquent by LTV Range



- **Description**: Horizontal bar chart showing delinquencies by Loan-to-Value (LTV) ratio ranges.
- **Findings**:
  - Highest delinquencies are in **60–80%**, **90–100%**, and **80–90%** ranges (all ~15K–18K).
  - Delinquency sharply drops for **<60%** and is negligible for **>100%**.
- **Conclusion**: Mid to high LTV loans are riskier in terms of delinquency. Lower LTV (<60%) loans are more secure and show fewer delinquencies.

---

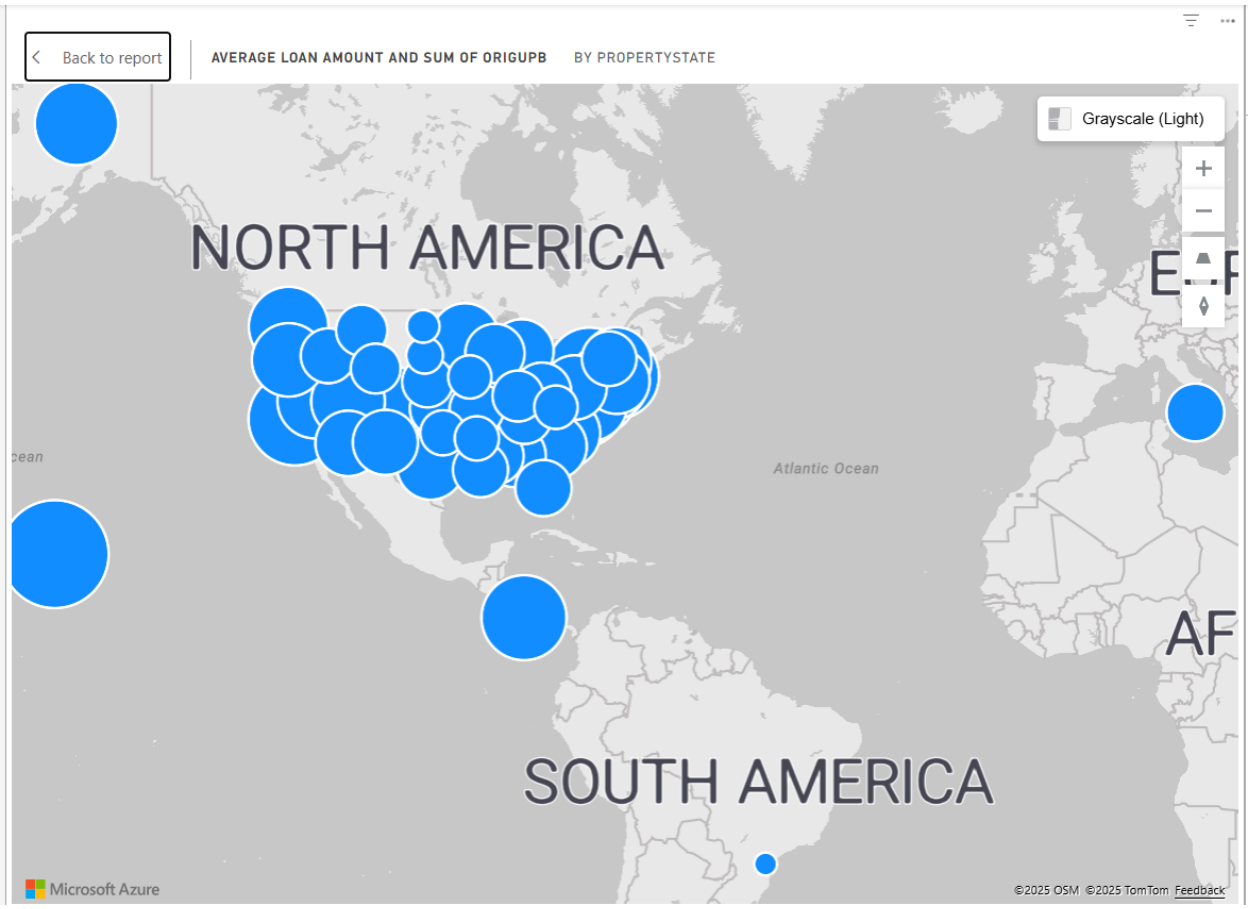
5. Sum of OrigUPB by Channel



- **Description**: Bar chart indicating original unpaid principal balance (OrigUPB) by loan origination channel.
- **Findings**:
  - **T** (likely Retail/Direct): ~20 billion
  - **R** (possibly Correspondent): ~12 billion
  - **C** and **B** have very low volumes.
- **Conclusion**: Most origination volume comes from T and R channels. Focus on monitoring performance and quality in these high-volume channels.

---

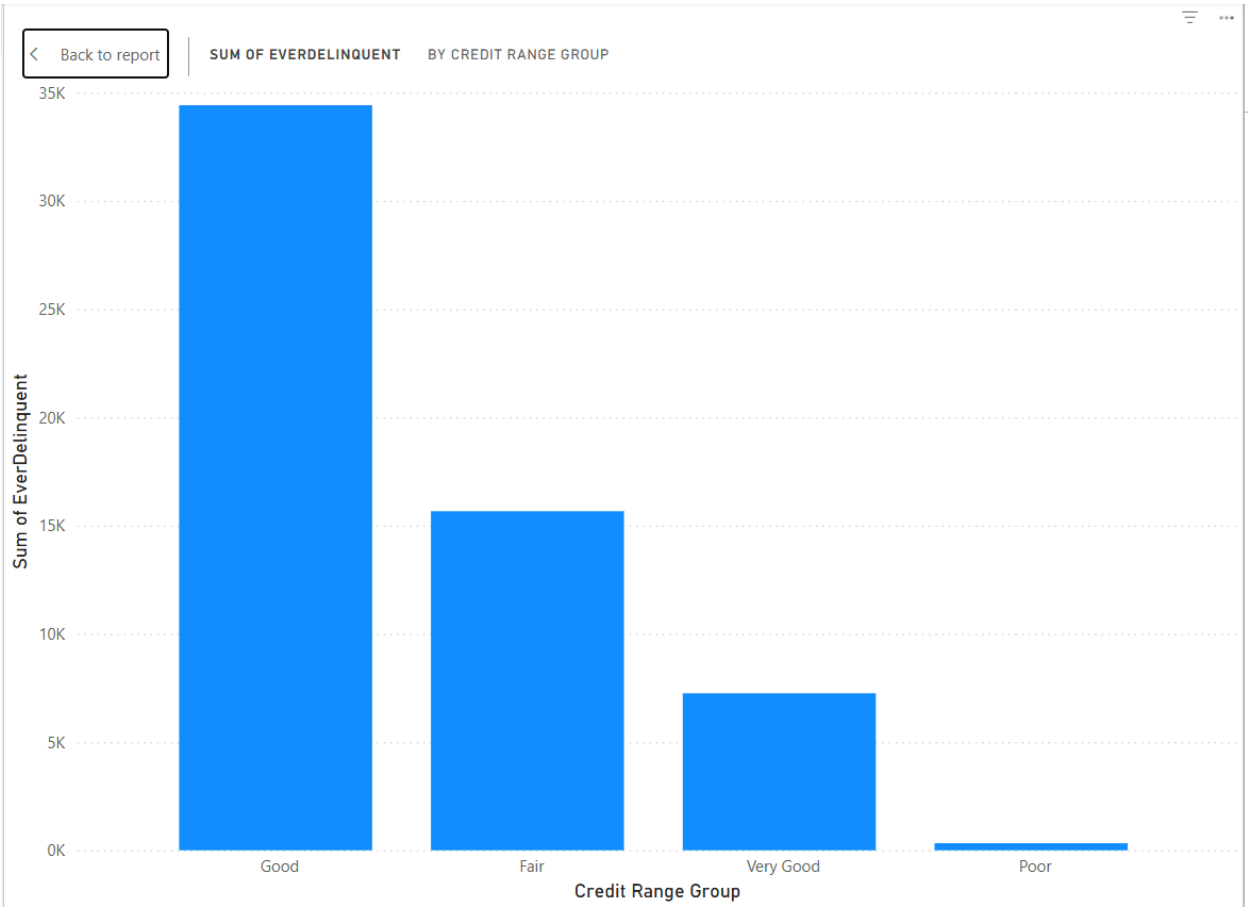
6. **Average Loan Amount and Sum of OrigUPB by PropertyState (Map)**



- **Description**: A map showing average loan sizes and unpaid balances by U.S. state.
- **Findings**:
  - Larger bubbles (high loan volumes) are concentrated in populous states like California, Texas, and Florida.
- **Conclusion**: These high-volume states should be closely monitored for economic trends that could impact portfolio performance.

---

7. **Sum of EverDelinquent by Credit Range Group**



- **Description**: Bar chart showing delinquency totals by credit score grouping.
- **Findings**:
  - **Good** credit borrowers have the most delinquencies (~30K).
  - Followed by **Fair**, **Very Good**, and minimal for **Poor** and **Excellent**.
- **Conclusion**: Despite being considered relatively safe, borrowers in the "Good" category show notable delinquency. This may warrant deeper analysis into other risk indicators (e.g., DTI, LTV).

Summary Conclusions

- **Loan Purpose**: Purchase loans dominate the portfolio; however, these may also pose delinquency risks depending on LTV and credit factors.
- **Occupancy Risk**: Owner-occupied loans are more delinquent than investor or second-home properties.
- **LTV and Risk**: Higher LTVs correspond to higher delinquency, reinforcing the importance of down payments and equity buffers.
- **Credit Score Anomaly**: “Good” credit borrowers have higher delinquency than expected, suggesting credit score alone may be insufficient for risk assessment.
- **Channel Strategy**: The T and R channels are responsible for most loan volume—these should be the focus of origination quality reviews.
- **Geographic Exposure**: States with high loan concentration need targeted risk monitoring due to their outsized influence on portfolio health.
